SUBMISSION AIM:	To implement the various functions e.g. linear, non-
A1IVI.	
	linear, quadratic, exponential etc. The input (i.e. n) to all the above
	functions varies from 0 to 100 with in answered of 1. Then add the
	functions varies from 0 to 100 with increment of 1. Then add the
A L CODITION	function n! in the list and execute the same for n from 0 to 20.
ALGORITHM	1. Declare floating variables a1,a2,a3,a4,a5,a6,a7,a8,a9,a10.
	2. Assign a function to each variable –
	a1=pow(3.0,i)/pow(2.0,i);
	a2=pow(i,3);
	a3=pow(log2(i),2);
	a4=log2(factorial(i));
	a5=pow(2,(pow(2,i)));
	a6=i;
	a7 = log(log(i));
	a8=log2(i);
	a9=i*(pow(2,i));
	a10=pow(i,(log2(log2(i))));
	3. Create a floating variable fact and assign it the factorial function.
	float fact=factorial(i);
	4. Print the results of all these functions for numbers 1 to 100.
	5. Paste the result in an Excel sheet and create graphs for all functions

RESULT (SNAPSHOT):

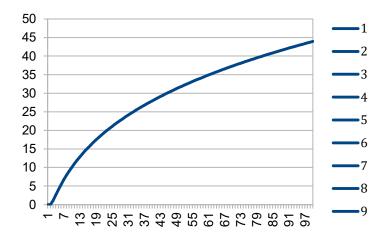

1. $(3/2)^n$

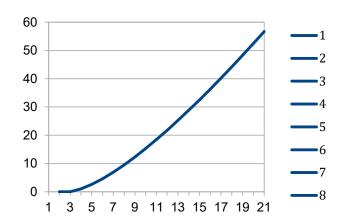

2. n^3

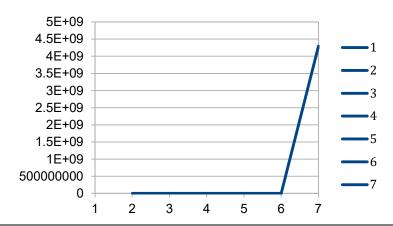

3. (lg(n))^2

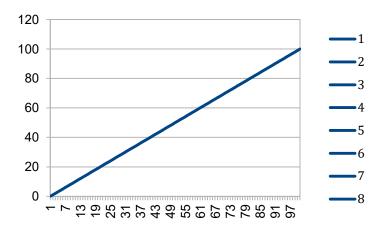

4. lg(n!)

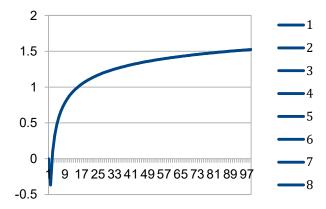

5. 2^(2^n)

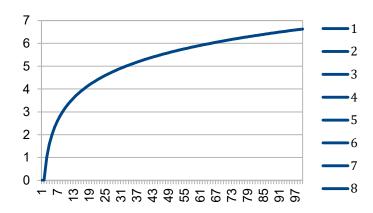

6. n

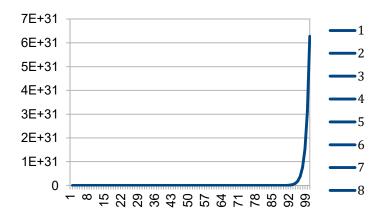

7. ln(ln(n))

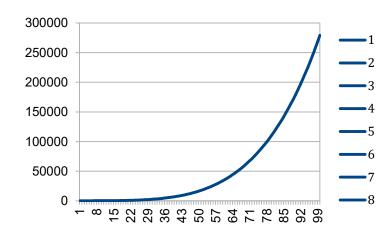

8. lg(n)

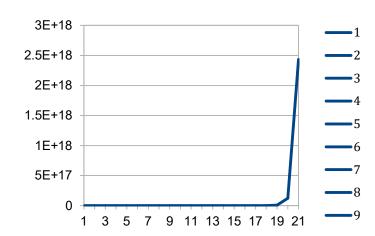

9. n*(2^n)

$10.n^{(lg(lg(n)))}$

11.n!

CONCLUSION:

With the help of this experiment, I was able to understand and implement various functions graphically and was also able to note the changes in the values of the functions when input is varied from 0 to 100.
